

A small green seedling with three leaves is growing from a forest floor covered in brown leaves and twigs. The seedling is positioned in the center-left of the frame, and its leaves are a vibrant green color. The background is a dense, out-of-focus layer of brown leaves and twigs, creating a natural, earthy setting.

REGENERATIVE

COFFEE

REGENERATIVE COFFEE

IS THAT A THING?

THE DEFINITION

COFFEE THAT LEAVES THE LAND BETTER THAN IT FOUND IT.

Not less bad. Better. Nine layers of practice and measurement, from Vedic-rooted ferments to Aura's own pattern-reading software, all pointed at that one sentence. Every other claim in this deck is evidence for it.

A close-up, slightly blurred photograph of several hands, likely belonging to people of African descent, digging through dark, rich, moist soil. The hands are positioned around the center and right side of the frame, with fingers spread, actively turning over the earth. The lighting is soft and natural, highlighting the texture of the soil and the skin tones. The overall mood is one of labor and connection to the land.

COFFEE DOESN'T BEGIN WITH COFFEE.

IT BEGINS ABOUT A METRE UNDERGROUND.

THE ONLY CLAIM YOU CAN CHECK

SAYS WHERE THE GROUND IS GOING

Organic

Regenerative

BIODYNAMIC

GROWN IN A CLOSED LOOP.

THE ESTATE

ONE ESTATE. ONE HARVEST A YEAR.

Sampigekhan Estate — Mudigere, Chikmagalur, Karnataka. 150 acres, 100 of them in coffee. Small is the strategy.

150 ACRES.
3,600 FEET.
35,000 TREES.

RED LATERITE, PH 6.0-6.5 · 40-100 IN OF RAIN · 14-30 °C

ARABICA SLN.9 AND SLN.795 · WESTERN GHATS, KARNATAKA

THE ENGINE

OUR BEST FARMERS HAVE FOUR LEGS.

Fifty-two Malnad Gidda — indigenous to these hills, grazing them for centuries before anyone thought to write it down.

They eat the same 150 acres the coffee grows in. What they take from a block, they give back to it.

Almost everything this soil is fed begins in their bodies.

Alongside Jeevamrit, the estate keeps older ferments too — coconut milk, curd, buttermilk — the same cow-centred method India was using long before anyone called it biodynamic.

BEFORE AND AFTER

NOTHING UNTESTED REACHES SOIL

THE MECHANISM

NOTHING COMES IN. NOTHING LEAVES.

At first light the dung is gathered fresh, weighed, and split three ways — to the compost pits, to the microbial brews, to the horns.

154,000 litres of Jeevamrit a year. Each barrel stirred by hand about forty-five minutes a day, one direction then the other.

2,420 kg of Cow Pat Pit a year across fourteen numbered pits, matured ninety days and dug in ball by ball at a named root.

Coffee husk and prunings, charred on-site into biochar, go back into the same pits — carbon that would otherwise burn off, locked into the soil instead.

THE UNIT OF RECORD

ONE RECORD, IN FULL

BD 501 · Block 07 · 06:14
waning moon · humidity 78%
by Raju · dung batch G-03

The minute. The moon. The hand. The source.

Machines write their own readings. Every human act is signed from the field, by the person who did the work.

That row is the unit the whole system is built to protect.

THE RULE

NO UNTESTED MATERIAL TOUCHES THE SOIL.

Every batch is read in the estate's own lab before and after — pH, conductivity, microbial colony counts, Trichoderma, Pseudomonas, Bacillus. A leaf is diagnosed before it is treated, never the other way round. A batch that comes back wrong is corrected or held. Never sprayed.

TWO CIRCLES, TURNING TOGETHER

OUTCOME FEEDS THE NEXT BATCH

Ninety days after a preparation goes on, the block it fed is retested and cross-referenced against the batch.

Did the microbes take? Did the carbon rise? Did the block move? Observe, understand, intervene, measure, learn, regenerate — the same loop, run on every input.

AND HERE IS WHAT WE CAN'T PROVE.

WE CARRY A FRACTION OF A FERMENTING BATCH FORWARD INTO FRESH CHERRY, THE WAY A SHERRY CELLAR CARRIES ITS CULTURE. CAN A COFFEE FERMENT HOLD A HOUSE CULTURE FROM ONE SEASON TO THE NEXT? NOBODY HAS SHOWN IT. WE ARE TESTING IT, YEAR BY YEAR.

WE'D RATHER TELL YOU THAT THAN SELL YOU THE METAPHOR.

SAID BEFORE YOU ASK

WE ARE NOT CERTIFIED ORGANIC OR BIODYNAMIC.

We practise both, and publish the record instead. The 32-acre tea block is in organic transition, targeting 2027.

COMPLETE TRANSPARENCY

ANIMAL → PREPARATION → SOIL → CHERRY → CUP.

Every lot carries its own file: harvest weight, immature removed, floats removed, Brix, water TDS, ferment hours, drying days.

pH every fifteen minutes through the ferment. Temperature three times daily. Screen grading and defect analysis per SCA protocol.

Held in plain JSON and CSV — files that will still open in a decade.

FLAVOURFUL

SIX LOTS. ONE HARVEST. NO TWO CUPS THE SAME.

THE DISCIPLINE

ONLY FULLY RIPE CHERRIES ARE PLUCKED.

Minimum 95% ripeness. Every float removed. Ferment stopped at pH 4.2 — by the number, not by nose.

THE SAME CHERRY, PICKED THE SAME MORNING, BECOMES SIX COFFEES.

TERROIR ALONE DOES NOT EXPLAIN THE SPREAD BETWEEN THEM.
TERROIR EXPRESSED THROUGH TECHNIQUE DOES.

006 Solera Wash

23% BRIX — THE HIGHEST
THE RAREST

THE HONEST FOOTNOTE

ALTITUDE AND VARIETY SET THE CEILING.

The ferment only decides how much of that ceiling the cup reaches.

A sealed ferment or a chosen yeast moves a cup by a point or three — real, measurable, and worth chasing.

Anyone who tells you the process alone makes the coffee is skipping the harder half of the story.

THE CUP IS PROOF OF THE YEAR THAT MADE IT.

COFFEE IS AGRICULTURAL MEMORY MADE DRINKABLE.

YES, IT IS.
